is about...

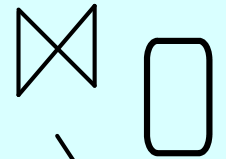

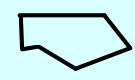

Problems involving angle measures.

Polygons

Key characteristics of polygons: side and angle amounts and measures

What makes a polygon...

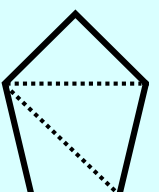

- 2-dimensional & closed
- no curves
- no intersecting lines

| polygons | non-polygons |
|---|---|
|  |  |
|  |  |

Angle Sums

The sum of the interior angles of a triangle is 180°

The sum of the interior angles of an n-sided polygon is $(n - 2)180^\circ$

5 sides

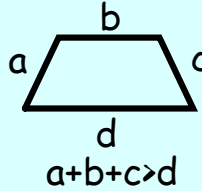

$5 - 2 = 3$ triangles

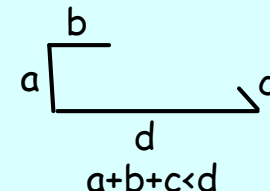

sum of interior angles =

$3(180^\circ) = 540^\circ$

Designing Quadrilaterals

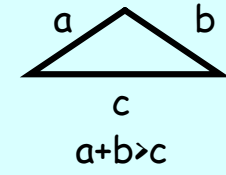

The sum of the three shortest sides must be greater than the longest side.

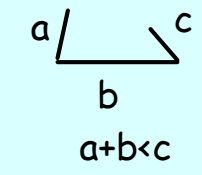

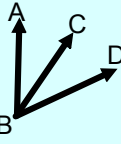

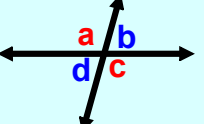

Designing Triangles

The sum of the two shortest sides must be greater than the longest side.

| <p>Learning Targets</p> | <ul style="list-style-type: none"> I understand the properties of polygons that affect their shape and size. I understand the special relationships among angles. I can draw geometric shapes (with a ruler, protractor, and technology, and by freehand) with given conditions. I can use facts about angles to write and solve simple equations for unknown angles. | | |
| <p>Unit Vocabulary</p> | <p>1. Degree a unit used to describe the measure of an angle or a rotation</p> | <p>8. Tiling/Tessellation the covering of a plane surface with geometric shapes without gaps or overlaps "beehive" </p> | |
| | <p>2. Right Angle one-quarter rotation commonly marked with a small square </p> | <p>9. Convex Polygon polygon with all interior angles measure less than 180° </p> | <p>10. Concave Polygon polygon with at least one interior angle that measures greater than 180° </p> |
| | <p>3. Complementary Angles two angles that have a sum of 90°</p> | <p>11. Interior Angle angle inside a polygon formed by two adjacent sides</p> | <p>12. Exterior Angle angle which forms a linear pair with the interior angle</p> |
| | <p>4. Supplementary Angles two angles that have a sum of 180°</p> | <p>13. Parallelogram a quadrilateral where the pairs of opposite sides are parallel</p> | <p>14. Rectangle a parallelogram with four right angles</p> |
| | <p>5. Adjacent Angles two angles that share a common vertex and common side but do not overlap <ABC is adjacent to <CBD </p> | <p>15. Parallel Lines lines in a plane that remain the same distance apart and never meet ex/ railroad tracks, lines on notebook paper</p> | |
| | <p>6. Regular Polygon a polygon where all sides are the same length AND all angles have the same measure</p> | <p>16. Transversal a line that intersects two other lines </p> | |
| | <p>7. Irregular Polygon sides are not the same length OR angles are not the same measure</p> | <p>17. Vertical Angles opposite pairs of angles </p> | |
